

Mobile Editor Performance Report

Users reported typing latency on mobile editor sessions during peak hours. The lag was most noticeable when a document exceeded 2,000 blocks.

Profiling showed the block tree re-rendered on every keystroke. We batched updates behind a single animation frame, which cut the p95 keystroke-to-render time from 180ms to 45ms on low-end Android devices.

A secondary issue was font loading: the editor blocked on a webfont that was not cached. Preloading the font removed a 300ms stall on the first keystroke after navigation.
