

Q2 Infrastructure Review

The search cluster handled 4.2 million queries this quarter with a p99 latency of 210ms.

Cold start times on the ingestion workers dropped sharply after we pinned the embedding model in memory instead of loading it on the first request.

A recurring ERR_TIMEOUT_504 on the upstream gateway was traced to a misconfigured keepalive setting; raising the idle timeout to 75 seconds eliminated it.

Storage grew 30% quarter over quarter, driven mostly by original file retention in the object store. We are evaluating a lifecycle policy to move files older than one year to cold storage.

Next quarter we plan to add a nightly reindex job and to shard the keyword index once it crosses ten million chunks.
